

DEVICE FOR THE CONTROLLED INHALATION OF THERAPEUTICAL AEROSOLS

Abstract

- 5 [24] A device for the controlled inhalation of therapeutic aerosols
comprises means providing individual patient parameters and/or
aerosol parameters for the inhalation. The aerosol doses, such as the
tidal volume and the respiratory flow, are individually adjusted on the
basis of these individual parameters. Thus, the inhalation device may
10 be individually adjusted to the patient to be treated.
